

Concepts of Epidemiology
8th – 12th December 2014

CONTENTS

**(Numbers correspond to book sections that will be covered in course-
participants are invited to learn the remainder of the book on their own)**

- Session 1 What is epidemiology? The nature and scope of a biological, social and ecological science and of its variables**
- 1.1 The individual and the population
 - 1.2 Definition of epidemiology and statement of its central paradigm
 - 1.3 Directions in epidemiology and its uses
 - 1.4 Epidemiology as a science, practice and craft
 - 1.5 The nature of epidemiological variables
 - 1.6 A disease and health problem: an illustration of the interdependence of clinical medicine and epidemiology (Exercise)
 - 1.8 Seeking the theoretical foundations of epidemiology
- Session 2 The epidemiological concept of population**
- 2.1 The individual and the population
 - 2.2 Harnessing heterogeneity in individual and group level disease and risk factor pattern
 - 2.3 Disease patterns as a manifestation of individuals living in changing social groups
 - 2.4 Sick populations and sick individuals
 - 2.7 The dynamic nature of human population
 - 2.8 Applications of the population concept
- Session 3: Variation in disease by time, place and person: A framework for analysis**
- 3.1 Introduction
 - 3.2 Reasons for analysing disease variations
 - 3.4 Variations and associations: real or artefact?
 - 3.5 Applying the real-artefact framework
 - 3.6 Disease clustering and clusters in epidemiology
 - 3.7 Applications of observations of disease variation
 - 3.8 Epidemiological theory underpinning variations
- Session 4: Variation: role of error, bias, confounding and risk modification (interaction)**
- 4.1 Introduction
 - 4.2 A classification of error and bias
 - 4.2.1 The research question, theme or hypothesis
 - 4.2.2 Choice of population

- 4.2.3 Non-participation
- 4.2.4 Comparing disease patterns and risk factor-disease outcome relationships in populations which differ (confounding)
- 4.2.5 Risk/effect modification, susceptibility and interaction
- 4.2.6 Measurement: differential and non-differential
- 4.2.8 Analysis and interpretation
- 4.2.9 Publication
- 4.2.10 Judgement and action

Session 5: Cause and effect: the epidemiological approach

- 5.1 Introduction: causality in science and philosophy
- 5.2 Epidemiological strategy and reasoning: the example of Semelweis
- 5.3 Models of cause in epidemiology
 - 5.3.1 Interplay of host, agent and environment
 - 5.3.1 Necessary and sufficient cause
- 5.4 Guidelines for epidemiological reasoning
 - 5.4.2 Application of guidelines to associations
 - 5.4.5 Interpretation of data, study design and causal guidelines

Session 6: Natural history, spectrum, iceberg, and screening: interrelated concepts in the epidemiology of disease

- 6.1 Natural history of disease
- 6.3 Spectrum of disease
- 6.4 The unmeasured burden of disease: the metaphors of the iceberg and the pyramid
- 6.5 Screening: measuring the accuracy of the test: sensitivity, specificity and predictive powers
- 6.6 Applications of the concepts of natural history, spectrum and screening
- 6.7 Epidemiological theory: symbiosis with clinical medicine and social sciences

Session 7: The concept of risk and measures of disease frequency: incidence and prevalence

- 7.1 Introduction: risks, risk factors and causes
- 7.2 Quantifying risks, risk factors, and their relationships
- 7.3 Incidence and incidence rate: the perspective of incidence density and cumulative incidence (or proportion)
- 7.4 Numerator
- 7.5 Denominator
- 7.6 Prevalence and prevalence rate (or proportion)
- 7.8 Choice of incidence or prevalence
- 7.9 Presenting rates

Session 8: Presentation and interpretation of epidemiological data on risk

- 8.1 Introduction
- 8.3 Adjusted overall rates: standardisation and the calculation of the SMR
- 8.4 Relative risk
- 8.5 The odds ratio (OR)
- 8.6 Measurements to assess the impact of a risk factor in groups and populations
- 8.6.2 Population attributable risk
- 8.11 Numbers needed to treat (NNT) or to prevent (NNP)

Session 9: Study design: overview

- 9.1 Introduction: interdependence of study design
- 9.2. Classifications of study design: five dichotomies
- 9.3 Case-series: clinical and population based
- 9.4 Cross-sectional study
- 9.5 Case-control study
- 9.6 Cohort study
- 9.7 Trials
- 9.8 Overlap in the conceptual basis of the case-series, cross-sectional, case-control, cohort and trial designs

Session 10: Theoretical, ethical, contextual, practical and critical foundations for future epidemiology

- 10.1 The interrelationship of theory, methods and applications: a question of values
- 10.2 Fundamental influences on health
- 10.6 Epidemiology: forces for change
- 10.9 The practice of epidemiology in public health.
- 10.10 Ethical basis and proper conduct of epidemiology
- 10.12 Some questions relevant to the appraisal of epidemiological research
- 10.15 A reflection on the future of epidemiology
